## SUMMARY

According to the invention, there is provided a vector for the expression of immunoglobulin-cytokin fusion proteins in malignant B cells at least containing operably linked to each other

- (a) a region of at least 1.5 kb which is homologous to a region of the  $\mu$  intron or the  $\kappa$  intron and which lacks a functional  $C_{\mu}$  or  $C_{\kappa}$  enhancer or contains a non-functional  $C_{\mu}$  or  $C_{\kappa}$  enhancer;
- (b) at least one DNA sequence encoding a domain of an immunoglobulin or a part thereof;
  - (c) a DNA sequence encoding a cytokin; and
- (d) a marker gene selectable in eukaryotic B cells and lacking a functional enhancer region wherein the expression of said marker following integration is controlled by the cellular  $C_{\mu}$  or  $C_{\kappa}$  enhancer.
